

# Angular a Web Framework

Web Framework: Crafted for Users, Powered by Google

## Day 24 – NG-2 – Angular Assignment

### Task 1: Create a Policy model

- policyNumber: string;
- customerName: string;
- policyType: string;
- premium: number;
- isActive: boolean;

Initialize it in constructor of class and display as:

Policy Number : POL1001  
Customer : Rajesh Kumar  
Policy Type : Health Insurance  
Premium : ₹18,500  
Status : Active

Bind the policy status to a CSS class.

Bind the disabled property of a button based on isActive.

### Task 2: Create a small Insurance Premium Calculator.

The user enters:

- Customer name
- Age
- Sum insured

The application calculates a basic premium when the user clicks Calculate Premium.

UI-Sample

Customer Name : [\_\_\_\_\_]

Age : [\_\_\_\_\_]

Sum Insured : [\_\_\_\_\_]

[ Calculate Premium ]

Customer : Rajesh

Premium : ₹25,000

Use this simplified business rule:

- Age  $\leq$  30  $\rightarrow$  Premium = Sum Insured  $\times$  2%
- Age 31 - 50  $\rightarrow$  Premium = Sum Insured  $\times$  3%
- Age  $>$  50  $\rightarrow$  Premium = Sum Insured  $\times$  5%

# Angular a Web Framework

**Web Framework: Crafted for Users, Powered by Google**

**Task 3:** An insurance company wants a small dashboard that displays policy information differently depending on its status. Possible statuses:

- Active
- Expired
- Pending
- Cancelled

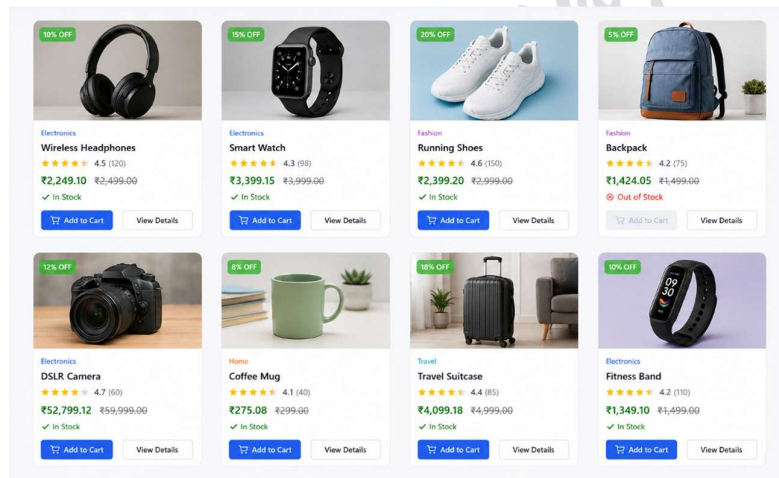

Create a policy object, and display the appropriate message as:

- Active → Policy is currently active.
- Expired → Policy has expired. Please renew.
- Pending → Policy is awaiting approval.
- Cancelled → Policy has been cancelled.

Also create a button named Change Status. Each click on button should cycle through:

Active → Pending → Expired → Cancelled → Active

**Task 4:** Create an Angular application implemented style using Tailwind CSS. Output should look a like

Each card should display:

- Product image
  - Product name
  - Category
  - Price
  - Rating
  - Availability
  - Discount
  - Add to Cart button
  - View Details button
- Create Product Component
  - Create Static Product Data using a file product-card.ts
  - First Databinding using Interpolation
    - Product name
    - Category
    - Price
    - Rating

# Angular a Web Framework

**Web Framework: Crafted for Users, Powered by Google**

- Add Product Image using property binding.
  - Use [src] as imageUrl from class
- Build the Product Card Using Tailwind
- Display Component in App Component
- Add More Products
- Display Products Using Angular Control Flow
