

Angular a Web Framework

Web Framework: Crafted for Users, Powered by Google

Day 23 – NG – 1 – Assignment

You are developing a basic Insurance Company Information Portal. The application should provide static information about:

- | | |
|-----------------------|------------------------|
| 1. Insurance company | 3. Customer services |
| 2. Insurance products | 4. Contact information |

The purpose is not to build a functional insurance application yet. It is only to understand how an Angular application is structured. Build an Angular basic application that covers:

- | | |
|----------------------------------|------------------------------------|
| • Angular application structure | • Inline CSS styles |
| • Angular CLI project creation | • External CSS styles |
| • Components and Component files | • Basic TypeScript component class |
| • Inline HTML templates | • Component selector |
| • External HTML templates | • Displaying static HTML content |

Task1: Create the Angular Application using Angular CLI. Write execution process of Angular application and various options like PORT, Skipping Test etc.

Task2: Explain the Application Architecture, define major building blocks of Angular application. Also write a flow of application from ng new ... to Page Responses output.

Task3: Explain the role of all JSON file provided in default application.

Task4: Create a Basic Component

- Create a component: company-info
- Expected files:
 - company-info/
 - company-info.ts
 - company-info.html
 - company-info.css
- The component should display:
 - ABC Insurance Company
 - Protecting You. Securing Your Future.
 - About Us
 - Add a few static paragraphs describing the fictional insurance company.

Task5: Create another component using External HTML Template

- Name: insurance-products
- Use an: **external HTML file**.
 - The component should contain static information about:
 - **Insurance Products**

▪ Health Insurance	▪ Travel Insurance
▪ Life Insurance	▪ Home Insurance
▪ Motor Insurance	

Angular a Web Framework

Web Framework: Crafted for Users, Powered by Google

- The HTML should contain appropriate headings, paragraphs and lists.
- Create insurance-products.css as External Style Sheet
- Apply styles such as:
 - Heading formatting
 - Font size
 - Margins
 - Padding
 - Borders
 - Background
 - Product sections
 - List styling

Task6: Create Component Using Inline Template

- Now create: customer-service component but This time, **do not create an HTML file**.
- The HTML template should be written directly inside the component's TypeScript file.
- Display static information such as:
 - Customer Services
 - Policy Support
 - Claims Assistance
 - Premium Payment Support
 - Policy Renewal
 - Customer Feedback

Task7: Create another component contact-info, for this component:

- HTML should be inline
- CSS should also be inline

The component should display:

Contact Us
ABC Insurance Company
Email: support@abcinsurance.com
Phone: 1800-123-4567
Office:
Hyderabad
Telangana, India

Create entire application using HTML, CSS basics in Angular application. Application looks almost professional web page but static. Use good Images and various CSS style etc.
