

Angular a Web Framework

Web Framework: Crafted for Users, Powered by Google

Day 26 – Angular Assignment

Create an Angular 20 application that shows employee records in a table with the following features:

- Display employee records in a table
- Edit employee record (inline or with form)
- Delete employee record
- Add new employee using a form

using a **service + REST API** (instead of local array).

Application Flow

1. **EmployeeService** → Handles API calls (CRUD) using HttpClient.
2. **EmployeeComponent** → UI (table + form). Calls service methods.
3. **Backend** → For testing, you can use json-server as REST API.

The first screenshot shows the 'Employee List' page with a table containing three employees:

ID	Name	Role	Salary	Actions
1	Ravi Kumar	Developer	₹45678	View Edit Delete
2	Neha Sharma	Designer	₹45000	View Edit Delete
3	Amit Verma	Manager	₹70000	View Edit Delete

The second screenshot shows the 'Add Employee' form with input fields for Name, Role, and Salary, and an 'Add' button.

The third screenshot shows the 'Employee Details' page for Ravi Kumar (ID: 1), displaying his role as Developer and salary as ₹45678, with a 'Back' button.
