Day 29 – Angular Auth Guards

While working with Authentication – Login section, there is one loophole, if you logoff it will divert to Login Page and even when we have cleared logged-in user data from local storage. Now if you directly use URL for Dashoard it will display user but not the logged-in user as it is not logged in page.

In Angular, guards are scripts that control access to different parts of an application by deciding whether to allow or deny a user's navigation to a specific route.

Implement Auth Guard so that to use any authorized route, it should follow the rules of authentication. No direct request using URL in browser. If without login try to access it should direct to Login component.

Prove Full-Stack Power
